YoGoKo deploys V2X communications in Brittany

First published in ITS World Congress 2018 Daily News Day 1as YoGoKo deploys V2X in Brittany

YoGoKo has installed its vehicle to everything (V2X) communication equipment on more than 100 road maintenance vehicles as part of the SCOOP@F cooperative intelligent transport systems (C-ITS) pilot in France. The deployment is in Brittany, the country's second largest public market. The vehicles – including some motor coaches - are equipped with YoGoKo's hybrid (ITS-G5/cellular) communication system, built around Y-SMART unified software platform.

SCOOP@F is designed to show that systems based on the exchange of information between vehicles - and between vehicles (V2V) and roads – will make travel safer. Vehicles are equipped with sensors to detect events such as slippery conditions or emergency braking ahead, and with on-board units to transmit the information to vehicles behind and to the road operator (V2I) through road side units.

YoGoKo says it will follow up with the “industrialisation of its C-ITS solutions as part of the new pilot deployment projects at European level”.
